Abstract: The topic of finite-time stability criterion for neural networks with time-varying delays via a new argument Lyapunov-Krasovskii functional (LKF) was proposed and the time-varying delay of the system is without differentiable. For sufficient conditions of this study, a new (LKF) is combined with improved triple integral terms, namely the functionality of finite-time stability, integral inequality, and a positive diagonal matrix without using a free weighting matrix. The improved finite-time sufficient conditions for the neural network with time varying delay are given in terms of linear matrix inequalities (LMIs) and the results show improvement on previous studies. Numerical examples are given to illustrate the effectiveness of the proposed method.

Keywords: finite-time stability; neural networks; time-varying delays; integral inequality
Mathematics Subject Classification: 34D20, 34K20, 37C75

1. Introduction

Problems of artificial intelligence (AI) can involve complex data or tasks; consequently neural networks (NNs) as in [1–36] can be beneficial to overcome the design AI functions manually. Knowledge of NNs has been applied in various fields, including biology, artificial intelligence, static image processing, associative memory, electrical engineering and signal processing. The connectivity of the neurons is biologically weighted. Weighting reflects positive excitatory connections while a negative value inhibits the connection.

Activation functions will determine the outcome of models of learning and depth accuracy in the calculation of the training model which can make or break a large NN. Activation functions are also important in determining the ability of NNs regarding convergence speed and convergence, or in some
cases, the activation may prevent convergence in the first place as reported in [1–28]. NNs are used in processing units and learning algorithms. Time-delay is one of the common distinctive actions in the operation of neurons and plays an important role in causing low levels of efficiency and stability, and may lead to dynamic behavior involving chaos, uncertainty and differences as in [1–25]. Therefore, NNs with time delay have received considerable attention in many fields, as in [1–25].

It is well known that many real processes often depend on delays whereby the current state of affairs depends on previous states. Delays often occur in many control systems, for example, aircraft control systems, biological modeling, chemicals or electrical networks. Time-delay is often the main source of ambivalence and poor performance of a system.

There are two different kinds of time-delay system stability: delay dependent and delay independent. Delayed dependent conditions are often less conservative than independent delays, especially when the delay times are relatively small. The delayed security conditions depend mainly on the highest estimate and the extent of the delay allowed. The delay-dependent stability for interval time-varying delay has been broadly studied and adapted in various research fields in [3, 13–16, 19, 22–24, 28]. Time-delay that varies the interval for which the scope is limited is called interval time-varying delay. Some researchers have reported on NN problems with interval time-varying delay as in [1–5, 7, 11–15, 21, 25], while [16] reported on NN stability with additive time-varying delay.

There are two types of stability over a finite time interval, namely finite-time stability and fixed-time stability. With finite-time stability, the system converges in a certain period for any default, while with fixed-time stability, the convergence time is the same for all defaults within the domain. Both finite-time stability and fixed-time stability have been extensively adapted in many fields such as [26, 29–35, 37, 38]. In [34], J. Puangmalai and et. al. investigated Finite-time stability criteria of linear system with non-differentiable time-varying delay via new integral inequality based on a free-matrix for bounding the integral \[ \int_a^b x'(s)Mx(s)ds \] and obtained the new sufficient conditions for the system in the forms of inequalities and linear matrix inequalities. The finite-time stability criteria of neutral-type neural networks with hybrid time-varying delays was studied by using the definition of finite-time stability, Lyapunov function method and the bounded of inequality techniques, see in [37]. Similarly, in [38], M. Zheng and et. al. studied the finite-time stability and synchronization problems of memristor-based fractional-order fuzzy cellular neural network. By applying the existence and uniqueness of the Filippov solution of the network combined with the Banach fixed point theorem, the definition of finite-time stability of the network and Gronwall–Bellman inequality and designing a simple linear feedback controller.

Stability analysis in the context of time-delay systems usually applies the appropriate Lyapunov-Krasovskii functional (LKF) technique in [1–4, 6–28, 34, 36, 39] , estimating the upper bounds of its derivative according to the trajectories of the system. Triple and fourth integrals may be useful in the LKF to solve the solution as in [1, 2, 5, 8, 10–13, 16, 18, 19, 23, 25, 36, 39]. Many techniques have been applied to approximate the upper bounds of the LKF derivative , such as Jensen inequality [1, 2, 5, 6, 8, 11, 18, 19, 24, 25, 28, 34, 36, 39], Wirtinger-based integral inequality [4, 10], tighter inequality lemma [20], delay-dependent stability [3, 13–16, 19, 22–24, 28], delay partitioning method [9, 15, 27], free-weighting matrix variables method [1, 10, 15, 17, 18, 23, 26, 34], positive diagonal matrix [2, 5, 6, 8, 10–13, 16, 17, 19, 25, 27, 28] and linear matrix inequality (LMI) techniques [1, 3, 8, 9, 11–13, 15, 21, 23, 24, 26, 28, 39] and other techniques [9, 13, 14, 16, 18, 36]. In [4],
H. B. Zeng investigated stability and dissipativity analysis for static neural networks (NNs) with interval time-varying delay via a new augmented LKF by applying Wirtinger-based inequality. In [6], Z.-M. Gao and et. al proposed the stability problem for the neural networks with time-varying delay via new LKF where the time delay needs to be differentiable.

Based on the above, the topic of finite-time exponential stability criteria of NNs was investigated using non-differentiable time-variation. As a first effort, this article addresses the issue and it main contributions are:

- We introduce a new argument of LKF $V_i(t, x_t) = x^T(t)P_1x(t) + 2x^T(t)P_2 \int_{t-h_2}^{t} x(s)ds + \left( \int_{t-h_2}^{t} x(s)ds \right)^T P_3 \int_{t-h_2}^{t} x(s)ds + 2x^T(t)P_4 \int_{t-h_2}^{t} x(\delta)d\delta ds + 2 \left( \int_{t-h_2}^{t} x(s)ds \right)^T P_5 \int_{t-h_2}^{t-h_3} x(\delta)d\delta ds + \left( \int_{t-h_2}^{t-h_3} x(\delta)d\delta ds \right)^T P_6 \int_{t-h_2}^{t-h_3} x(\delta)d\delta ds$ to analyze the problem of finite-time stability criteria of NNs. The augmented Lyapunov matrices $P_i, \ i = 1, 2, 3, 4, 5, 6$ do not to be positive definiteness.

- To apply to finite-time stability problems of NNs, the time-varying delay is non-differentiable which is different from the time-delay cases in [1–7, 15, 20].

- To illustrate the effectiveness of this research as being much less conservative than the finite-time stability criteria in [1–7, 15, 20] as shown in numerical examples.

To improve the new LKF with its triple integral, consisting of utilizing Jensen’s and a new inequality from [34] and the corollary from [39], an action neural function and positive diagonal matrix, without free-weighting matrix variables and with finite-time stability. Some novel sufficient conditions are obtained for the finite-time stability of NNs with time-varying delays in terms of linear matrix inequalities (LMIs). Finally, numerical examples are provided to show the benefit of using the new LKF approach. To the best of our knowledge, to date, there have been no publications involving the problem finite-time exponential stability of NNs.

The rest of the paper is arranged as follows. Section 2 supplies the considered network and suggests some definitions, propositions and lemmas. Section 3 presents the finite-time exponential stability of NNs with time-varying delay via the new LKF method. Two numerical examples with theoretical results and conclusions are provided in Sections 4 and 5, respectively.

2. Problem formulation

This paper will use the notations as follows: $\mathbb{R}$ stands for the sets of real numbers; $\mathbb{R}^n$ means the $n$–dimensional space; $\mathbb{R}^{m \times n}$ is the set of all $m \times n$ real matrix; $A^T$ and $A^{-1}$ signify the transpose and the inverse of matrices $A$, respectively; $A$ is symmetric if $A = A^T$; If $A$ and $B$ are symmetric matrices, $A > B$ means that $A - B$ is positive definite matrix; $I$ means the properly dimensioned identity matrix. The symmetric term in the matrix is determined by $*$; and $\text{sym}(A) = A + A^T$; Block of diagonal matrix is defined by $\text{diag}(...)$.

Let us consider the following neural network with time-varying delays:

\[
\dot{x}(t) = -Ax(t) + Bf(Wx(t)) + Cg(Wx(t - h(t))),
\]

\[
x(t) = \phi(t), \ t \in [-h_2, 0],
\]

where $x(t) = [x_1(t), x_2(t), ..., x_n(t)]^T$ denotes the state vector with the $n$ neurons; $A = \text{diag}(a_1, a_2, ..., a_n) > 0$ is a diagonal matrix; $B$ and $C$ are the known real constant matrices with...
appropriate dimensions; \( f(W) = [f_1(W_1x), f_2(W_2x), ..., f_n(W_nx)] \) and 
\( g(W) = [g_1(W_1x), g_2(W_2x), ..., g_n(W_nx)] \) denote the neural activation functions; 
\( W = [W_1, W_2, ..., W_n] \) is delayed connection weight matrix; \( \phi(t) \in C([-h_2, 0, \mathbb{R}^n] \) is the initial function. The time-varying delay function \( h(t) \) satisfies the following conditions:

\[
0 \leq h_1 \leq h(t) \leq h_2, \quad h_1 \neq h_2, \tag{2.2}
\]

where \( h_1, h_2 \) are the known real constant scalars.

The neuron activation functions satisfy the following condition:

**Assumption 1.** The neuron activation function \( f(\cdot) \) is continuous and bounded which satisfies:

\[
k_i^- \leq f_i(\theta_1) - f_i(\theta_2) \leq k_i^+, \quad \forall \theta_1, \theta_2 \in \mathbb{R}, \quad \theta_1 \neq \theta_2, \quad i = 1, 2, ..., n. \tag{2.3}
\]

when \( \theta_2 = 0 \), Eq (2.3) can be rewritten as the following condition:

\[
k_i^- \leq f_i(\theta_1) \leq k_i^+, \tag{2.4}
\]

where \( f(0) = 0 \) and \( k_i^-, k_i^+ \) are given constants.

From (2.3) and (2.4), for \( i = 1, 2, ..., n \), it follows that

\[
[f_i(\theta_1) - f_i(\theta_2) - k_i^-(\theta_1 - \theta_2)][k_i^+(\theta_1 - \theta_2) - f_i(\theta_1) + f_i(\theta_2)] \geq 0, \tag{2.5}
\]

\[
[f_i(\theta_1) - k_i^- \theta_1][k_i^+ \theta_1 - f_i(\theta_1)] \geq 0. \tag{2.6}
\]

Based on Assumption 1, there exists an equilibrium point \( x^* = [x_1^*(t), x_2^*(t), ..., x_n^*(t)]^T \) of neural network (2.1).

To prove the main results, the following Definition, Proposition, Corollary and Lemmas are useful.

**Definition.** [34] Given a positive matrix \( M \) and positive constants \( k_1, k_2, T_f \) with \( k_1 < k_2 \), the time-delay system described by (2.1) and delay condition as in (2.2) is said to be finite-time stable regarding to \( (k_1, k_2, T_f, h_1, h_2, M) \), if the state variables satisfy the following relationship:

\[
\sup_{-h_2 \leq s \leq 0} |z^T(s)Mz(s), \dot{z}^T(s)M\dot{z}(s)| \leq k_1 \Rightarrow \dot{z}^T(t)Mz(t) < k_2, \quad \forall t \in [0, T_f].
\]

**Proposition 2.** [34] For any positive definite matrix \( Q \), any differential function \( z : [bd_L, bd_U] \to \mathbb{R}^n. \) Then, the following inequality holds:

\[
6bd_{UL}\int_{bd_L}^{bd_U} \dot{z}^T(s)Q\dot{z}(s)ds \geq \tilde{z}^T[\begin{bmatrix}-22Q & -10Q & 32Q \\ -16Q & -26Q & 26Q \\ 0 & 0 & -58Q \end{bmatrix}]\tilde{z},
\]

where \( \tilde{z}^T = [z(bd_U) - z(bd_L) ] \frac{1}{bd_{UL}} \int_{bd_L}^{bd_U} z(s)ds \) and \( bd_{UL} = bd_U - bd_L. \)
Lemma 3. [40] (Schur complement) Given constant symmetric matrices $X, Y, Z$ satisfying $X = X^T$ and $Y = Y^T > 0$, then $X + Z^TY^{-1}Z < 0$ if and only if
\[
\begin{bmatrix}
X & Z^T \\
Z & -Y
\end{bmatrix} < 0, \quad \text{or} \quad \begin{bmatrix}
-Y & Z \\
Z^T & X
\end{bmatrix} < 0.
\]

Corollary 4. [39] For a given symmetric matrix $Q > 0$, any vector $v_0$ and matrices $J_1, J_2, J_3, J_4$ with proper dimensions and any continuously differentiable function $z : [bd_L, bd_U] \rightarrow \mathbb{R}^n$, the following inequality holds:
\[
-\int_{bd_L}^{bd_U} \int_\delta^{bd_U} \tilde{z}^T(s)Q\tilde{z}(s)dsd\delta \leq \nu_0^T(2J_1Q^{-1}J_1^T + 4J_2Q^{-1}J_2^T)v_0 + 2\nu_0^T(2J_1\gamma_1 + 4J_2\gamma_2),
\]
\[
-\int_{bd_L}^{bd_U} \int_\delta^{bd_U} \tilde{z}^T(s)Q\tilde{z}(s)dsd\delta \leq \nu_0^T(2J_3Q^{-1}J_3^T + 4J_4Q^{-1}J_4^T)v_0 + 2\nu_0^T(2J_3\gamma_3 + 4J_4\gamma_4),
\]
where $bd_U = bd_U - bd_L$, $\gamma_1 = z(bd_U) - \frac{1}{2} bd_U \int_{bd_L}^{bd_U} z(s)ds$, $\gamma_2 = z(bd_U) + \frac{3}{2} bd_U \int_{bd_L}^{bd_U} z(s)ds - \frac{6}{(bd_U)^2} \int_{bd_L}^{bd_U} \int_{bd_L}^{bd_U} z(s)ds$, $\gamma_3 = \frac{1}{bd_U} \int_{bd_L}^{bd_U} z(s)ds - z(bd_L)$, $\gamma_4 = z(bd_U) + 4 \frac{6}{(bd_U)^2} \int_{bd_L}^{bd_U} \int_{bd_L}^{bd_U} z(s)ds$.

Lemma 5. [39] For any matrix $Q > 0$ and differentiable function $z : [bd_L, bd_U] \rightarrow \mathbb{R}^n$, such that the integrals are determined as follows:
\[
bd_U \int_{bd_L}^{bd_U} \tilde{z}^T(s)Q\tilde{z}(s)ds \geq \kappa_1^2 Q\kappa_1 + 3\kappa_2^2 Q\kappa_2 + 5\kappa_3^2 Q\kappa_3,
\]
where $\kappa_1 = z(bd_U) - z(bd_L)$, $\kappa_2 = z(bd_U) + z(bd_L) - \frac{2}{(bd_U)^2} \int_{bd_L}^{bd_U} z(s)ds$, $\kappa_3 = z(bd_U) - z(bd_L) + \frac{6}{(bd_U)^2} \int_{bd_L}^{bd_U} z(s)ds - \frac{12}{(bd_U)^4} \int_{bd_L}^{bd_U} \int_{bd_L}^{bd_U} z(s)dsd\delta$ and $bd_U = bd_U - bd_L$.

Lemma 6. [41] For any positive definite symmetric constant matrix $Q$ and scalar $\tau > 0$, such that the following integrals are determined, it has
\[
-\int_{-\tau}^{0} \int_{i+\delta}^{t} \tilde{z}^T(s)Q\tilde{z}(s)dsd\delta \leq -\frac{1}{\tau^2} \left( \int_{-\tau}^{0} \int_{i+\delta}^{t} z(s)dsd\delta \right)^T Q \left( \int_{-\tau}^{0} \int_{i+\delta}^{t} z(s)dsd\delta \right).
\]

3. Main results

Let $h_1, h_2$ and $\alpha$ be constants,
\[
h_{21} = h_2 - h_1, \quad h_{11} = h(t) - h_1, \quad h_{22} = h_2 - h(t),
\]
\[
\begin{align*}
N_1 &= \frac{1 - e^{-h_{11}}}{\alpha}, & N_2 &= \frac{1 - e^{-h_{21}}}{\alpha}, & N_3 &= \frac{1 - (1+\alpha h_1)e^{-h_{11}}}{\alpha^2}, & N_4 &= \frac{(1+\alpha h_2)e^{-h_{11}} - (1+\alpha h_2)e^{-h_{21}}}{\alpha^2}, & N_5 &= \frac{1 - (1+\alpha h_2)e^{-h_{21}}}{\alpha^2}, \\
N_6 &= \frac{-3 + 2h_1 + 4e^{-h_{11}} - 2e^{-h_{21}}}{\alpha^2}, & N_7 &= \frac{-3 + 2h_1 + 4e^{-h_{11}} - 2e^{-h_{21}}}{\alpha^2}, & N_8 &= \frac{-3 - 2(1+\alpha h_1)e^{-h_{11}} + 4e^{-h_{21}}}{\alpha^2}, & N_9 &= \frac{4e^{-h_{11}} - 4e^{-h_{21}} - 1}{\alpha^2},
\end{align*}
\]
\[
I = M_1^2 M_1^{-1} = M_1^{-1} M_1^2, \quad \tilde{P}_i = M_1^{-1} P_i M_1^{-1}, \quad i = 1, 2, 3, \ldots, 6, \quad \tilde{Q}_j = M_1^{-1} Q_j M_1^{-1}, \quad j = 1, 2, \quad \bar{R}_k = M_1^{-1} R_k M_1^{-1}, \quad k = 1, 2, 3, \ldots, 6, \quad \tilde{S} = M_1^{-1} S M_1^{-1}, \quad \bar{T}_l = M_1^{-1} T_l M_1^{-1}, \quad l = 1, 2, 3, 4,
\]
\[
\lambda = \lambda_{min}\left(\tilde{P}_1\right), \quad i = 1, 2, 3, \ldots, 6,
\]
\[
\lambda = \lambda_{max}\left(\tilde{P}_2\right) + 2\lambda_{max}\left(\tilde{P}_3\right) + \lambda_{max}\left(\tilde{P}_4\right) + 2\lambda_{max}\left(\tilde{P}_5\right) + \lambda_{max}\left(\tilde{P}_6\right).
\]
\[ V(t, x_t) = \sum_{i=1}^{10} V_i(t, x_t), \]  

where

\[ V_1(t, x_t) = x^T(t) P_1 x(t) + 2x^T(t) P_2 \int_{t-h_2}^{t} x(s)ds + \left( \int_{t-h_2}^{t} x(s)ds \right)^T P_3 \int_{t-h_2}^{t} x(s)ds + 2x^T(t) P_4 \int_{t-h_2}^{t} x(s)ds + 2 \left( \int_{t-h_2}^{t} x(s)ds \right)^T P_5 \int_{t-h_2}^{t} x(s)ds + \int_{t-h_2}^{t} x(s)ds + \left( \int_{t-h_2}^{t} x(s)ds \right)^T P_6 \int_{t-h_2}^{t} x(s)ds, \]

\[ V_2(t, x_t) = \int_{t-h_1}^{t} e^{\alpha(s-t)} x^T(s) Q_1 x(s)ds, \]

\[ V_3(t, x_t) = \int_{t-h_2}^{t} e^{\alpha(s-t)} x^T(s) Q_2 x(s)ds, \]

\[ V_4(t, x_t) = h_2 \int_{t-h_1}^{t} e^{\alpha(s-t)} x^T(s) R_1 x(s)ds, \]

We let

\[ V_5(t, x_t) = h_2 \int_{-h_2}^{t} \int_{t+s}^{t} e^{\alpha(s-r)} \xi^T(\delta) R_2 \xi(\delta) d\delta ds, \]

\[ V_6(t, x_t) = h_2 \int_{-h_2}^{0} \int_{t+s}^{0} e^{\alpha(s-r)} \xi^T(\delta) R_3 \xi(\delta) d\delta ds, \]

\[ V_7(t, x_t) = \int_{-h_2}^{0} \int_{-r}^{0} \int_{t+s}^{0} e^{\alpha(s-r)} \xi^T(\delta) S \xi(\delta) d\delta ds d\tau, \]

\[ V_8(t, x_t) = 2e^{-\alpha t} \sum_{i=1}^{n} \int_{0}^{W_i} [\lambda_1(\sigma_i s - f_i(s)) + \lambda_2(f_i(s) - \sigma_i s)] ds, \]

\[ V_9(t, x_t) = 2e^{-\alpha t} \sum_{i=1}^{n} \int_{0}^{W_i} [\gamma_1(\eta_i s - g_i(s)) + \gamma_2(g_i(s) - \eta_i s)] ds, \]

\[ V_{10}(t, x_t) = \int_{-h_1}^{0} \int_{-h_1}^{0} \int_{t+s}^{t} e^{\alpha(s-r)} \xi^T(\delta) T_1 \xi(\delta) d\delta ds d\tau \]

\[ + \int_{-h_1}^{0} \int_{-h_1}^{0} \int_{t+s}^{t} e^{\alpha(s-r)} \xi^T(\delta) T_2 \xi(\delta) d\delta ds d\tau \]

\[ + \int_{-h_1}^{0} \int_{-h_1}^{0} \int_{t+s}^{t} e^{\alpha(s-r)} \xi^T(\delta) T_3 \xi(\delta) d\delta ds d\tau \]

\[ + \int_{-h_2}^{0} \int_{-h_2}^{0} \int_{t+s}^{t} e^{\alpha(s-r)} \xi^T(\delta) T_4 \xi(\delta) d\delta ds d\tau. \]

Next, we will show that the LKF (3.1) is positive definite as follows:

Proposition 7. Consider an \( \alpha > 0 \). The LKF (3.1) is positive definite, if there exist matrices \( Q_i > 0, (i = 1, 2), R_j > 0, (j = 1, 2, 3), T_k > 0, (k = 1, 2, 3, 4), S > 0 \) and any matrices \( P_1 = P_1^T, P_3 = P_3^T, P_6 = P_6^T, P_2, P_4, P_5, P_3 \) such that the following LMI holds:

\[
\mathcal{H} = \begin{bmatrix}
\mathcal{H}_{11} & \mathcal{H}_{12} & \mathcal{H}_{13} \\
* & \mathcal{H}_{22} & P_5 \\
* & * & \mathcal{H}_{33}
\end{bmatrix} > 0, \tag{3.2}
\]

where

\[
\mathcal{H}_{11} = P_1 + h_2 e^{-2\alpha h_2} R_3 + 0.5 h_2 e^{-2\alpha h_2} S, \\
\mathcal{H}_{12} = P_2 - e^{-2\alpha h_2} R_3, \quad \mathcal{H}_{13} = P_4 - h_2^{-1} e^{-2\alpha h_2} S, \\
\mathcal{H}_{22} = P_3 + h_2^{-1} e^{-2\alpha h_2} (R_3 + Q_2), \quad \mathcal{H}_{33} = P_6 + h_2^{-3} e^{-2\alpha h_2} (S + S^T).
\]

Proof. We let \( z_1(t) = h_2 \mathcal{W}_4(t), \quad z_2(t) = h_2 \mathcal{W}_5(t) \), then

\[
V_1(t, x_t) = x^T(t) P_1 x(t) + 2 x^T(t) P_2 z_1(t) + z_1^T(t) P_3 z_1(t) + 2 x^T(t) P_4 z_2(t) + 2 z_1^T(t) P_5 z_2(t) + z_2^T(t) P_6 z_2(t),
\]

\[
V_2(t, x_t) \geq e^{-2\alpha h_2} \int_{-h_2}^{0} x^T(s) Q_2 x(s) ds = h_2 e^{-2\alpha h_2} z_1^T(t) Q_2 z_1(t),
\]
$$V_6(t, x_t) \geq h_2 e^{-2ah_2} \int_{-h_2}^{0} \int_{t+s}^{t} \dot{x}^T R_3 \dot{x} \, ds$$

$$\geq h_2 e^{-2ah_2} \int_{-h_2}^{0} -s^{-1} \left( \int_{t+s}^{t} \dot{x} \dot{\delta} \right)^T R_3 \left( \int_{t+s}^{t} \dot{x} \, d\delta \right) \, ds$$

$$\geq e^{-ah_2} \int_{-h_2}^{0} [x(t) - x(t+s)]^T R_3 [x(t) - x(t+s)] \, ds$$

$$= \begin{bmatrix} x(t) \\ z_1(t) \end{bmatrix}^T \begin{bmatrix} h_2 e^{-ah_2} R_3 & -e^{-ah_2} R_3 \\ h_2^{-1} e^{-ah_2} R_3 & * \end{bmatrix} \begin{bmatrix} x(t) \\ z_1(t) \end{bmatrix}.$$

\[\Sigma_{5,5} = -48K_2 e^{-2ah_1} + 48K_4 e^{-2ah_1},\]

\[\Sigma_{6,6} = -720h_2 e^{-2ah_2} T_3 b_2 - 48K_{6} e^{-2ah_2} + 48K_{10} e^{-2ah_2},\]

\[\Sigma_{7,7} = -48K_8 e^{-2ah_2} - 720h_1 e^{-2ah_2} T_4 b_3 + 48K_{12} e^{-2ah_2}.\]
\textit{Proof.} Let us choose the LKF defined as in (3.1). By Proposition 7, it is easy to check that
\[
\mathcal{M}||x(t)||^2 \leq V(t, x_t), \quad \forall t \geq 0 \quad \text{and} \quad V(0, x_0) \leq \mathcal{M}||\phi(t)||^2.
\]

Taking the derivative of $V_i(t, x_t)$, $i = 1, 2, 3, ..., 10$ along the solution of the network (2.1), we get
\[
\begin{align*}
V_1(t, x_t) &= -2x^T(t)AP_1x(t) + 2x^T(t)P_1Bf(t) + 2x^T(t)P_1Cg_h(t) \\
&\quad + 2x^T(t)P_2[x(t) - x(t - h_2)] + 2h_2\mathcal{W}_4(t)P_2\dot{x}(t) \\
&\quad + 2h_2[x(t) - x(t - h_2)]^T P_3\mathcal{W}_4(t) + 2h_2x^T(t)P_4[x(t) - \mathcal{W}_4(t)] \\
&\quad + 2h_2\mathcal{W}_5(t)P_4\dot{x}(t) + 2h_2^2\mathcal{W}_5(t)P_5[x(t) - \mathcal{W}_4(t)] \\
&\quad + 2h_2[x(t) - x(t - h_2)]^T P_5\mathcal{W}_6(t) + 2h_2^2[x(t) - \mathcal{W}_4(t)]^T P_6\mathcal{W}_6(t), \\
V_2(t, x_t) &= x^T(t)Q_1x(t) - e^{-ah_1}x^T(t - h_1)Q_1x(t - h_1) - \alpha V_2(t, x_t), \\
V_3(t, x_t) &= x^T(t)Q_2x(t) - e^{-ah_2}x^T(t - h_2)Q_2x(t - h_2) - \alpha V_3(t, x_t), \\
V_4(t, x_t) &\leq h_2^2\dot{x}(t)R_1\dot{x}(t) - h_1e^{-ah_1}\int_{t-h_1}^t \dot{x}(s)R_1\dot{x}(s)ds - \alpha V_4(t, x_t), \\
V_5(t, x_t) &\leq h_2^2\dot{x}(t)R_2\dot{x}(t) - h_2e^{-ah_2}\int_{t-h_2}^t \dot{x}(s)R_2\dot{x}(s)ds - \alpha V_5(t, x_t), \\
V_6(t, x_t) &\leq h_2^2\dot{x}(t)R_3\dot{x}(t) - h_2e^{-ah_2}\int_{t-h_2}^t \dot{x}(s)R_3\dot{x}(s)ds - \alpha V_6(t, x_t), \\
V_7(t, x_t) &\leq h_2^2\dot{x}(t)S\dot{x}(t) - e^{-ah_2}\int_{t-h_2}^t \int_{t-\tau}^t \dot{x}(s)S\dot{x}(s)dsd\tau - \alpha V_7(t, x_t), \\
V_8(t, x_t) &\leq 2[L_1(D_1Wx^T(t) - f(Wx^T(t))) + L_2(f(Wx^T(t))) - E_1Wx^T(t)]W\dot{x}(t) - \alpha V_8(t, x_t), \\
V_9(t, x_t) &\leq 2[G_1(D_2Wx^T(t - h(t)) - g(Wx^T(t - h(t)))) + 2G_2(g(Wx^T(t - h(t)))) - E_2Wx^T(t - h(t))]W\dot{x}(t) - \alpha V_9(t, x_t), \\
V_{10}(t, x_t) &\leq \frac{h^2}{2}\dot{x}(t)[T_1 + T_2]\dot{x}(t) + \frac{h^2}{2}\dot{x}(t)[T_3 + T_4]\dot{x}(t) \\
&\quad - e^{-ah_1}\int_{t-h_1}^t \int_{t-\tau}^t \dot{x}(s)T_1\dot{x}(s)dsd\tau \\
&\quad - e^{-ah_1}\int_{t-h_1}^t \int_{t-h_1}^t \dot{x}(s)T_2\dot{x}(s)dsd\tau \\
&\quad - e^{-ah_2}\int_{t-h_2}^t \int_{t-h_1}^t \dot{x}(s)T_3\dot{x}(s)dsd\tau \\
&\quad - e^{-ah_2}\int_{t-h_2}^t \int_{t-h_2}^t \dot{x}(s)T_4\dot{x}(s)dsd\tau - \alpha V_{10}(t, x_t).
\end{align*}
\]

Define
\[
\chi_i = \begin{bmatrix}
22R_i & 10R_i & -32R_i \\
* & 16R_i & -26R_i \\
* & * & 58R_i
\end{bmatrix}, \quad i = 1, 2, 3, 4.
\]
Applying Proposition 2, we obtain

$$-h_1 e^{-ah_1} \int_{t-h_1}^t \dot{x}^T(s) R_1 \dot{x}(s) ds \leq -\frac{e^{-ah_1}}{6} \zeta_1^T(t) \chi_1 \zeta_1(t),$$

(3.12)

$$-h_2 e^{-ah_2} \int_{t-h_1}^{t-h_2} \dot{x}^T(s) R_2 \dot{x}(s) ds \leq -\frac{e^{-ah_2}}{6} \zeta_2^T(t) \chi_2 \zeta_2(t) - \frac{e^{-ah_2}}{6} \zeta_3^T(t) \chi_3 \zeta_3(t),$$

(3.13)

$$-h_2 e^{-ah_2} \int_{t-h_1}^{t} \dot{x}^T(s) R_3 \dot{x}(s) ds \leq -\frac{e^{-ah_2}}{6} \zeta_4^T(t) \chi_4 \zeta_4(t).$$

(3.14)

Applying Lemma 6, this leads to

$$-e^{-ah_2} \int_{t-h_1}^{0} \int_{t-\tau}^{\tau} \dot{x}^T(s) S \dot{x}(s) ds d\tau \leq -2h_2^2 e^{-2ah_2} [x(t) - W_4(t)]^T S [x(t) - W_4(t)].$$

From Corollary 4, we have

$$-e^{-ah_1} \int_{t-h_1}^{t} \dot{x}^T(s) T_1 \dot{x}(s) ds \leq -2e^{-ah_1} \sigma^T(t) [K_1 T_1^{-1} K_1^T + 2K_2 T_1^{-1} K_2^T + 2K_3 G_4 + 4K_4 G_4] \sigma(t),$$

(3.15)

$$-e^{-ah_1} \int_{t-h_1}^{t} \dot{x}^T(s) T_2 \dot{x}(s) ds \leq -2e^{-ah_1} \sigma^T(t) [K_3 T_2^{-1} K_3^T + 2K_4 T_2^{-1} K_4^T + 2K_5 G_5 + 4K_6 G_6] \sigma(t),$$

$$-e^{-ah_2} \int_{t-h_2}^{t} \dot{x}^T(s) T_3 \dot{x}(s) ds \leq -h_2 e^{-ah_2} \int_{t-h_2}^{t} \dot{x}^T(s) T_3 \dot{x}(s) ds + 2e^{-ah_2} \sigma^T(t) [K_5 T_3^{-1} K_5^T + 2K_6 T_3^{-1} K_6^T + 2K_7 G_7 + 4K_8 G_8] \sigma(t),$$

$$-e^{-ah_2} \int_{t-h_2}^{t} \dot{x}^T(s) T_4 \dot{x}(s) ds \leq -h_2 e^{-ah_2} \int_{t-h_2}^{t} \dot{x}^T(s) T_4 \dot{x}(s) ds + 2e^{-ah_2} \sigma^T(t) [K_7 T_4^{-1} K_7^T + 2K_9 G_9 + 4K_{10} G_{10}] \sigma(t).$$

By Lemma 5, we obtain

$$-h_2 e^{-ah_2} \int_{t-h_1}^{t} \dot{x}^T(s) T_3 \dot{x}(s) ds - h_1 e^{-ah_2} \int_{t-h_1}^{t} \dot{x}^T(s) T_4 \dot{x}(s) ds \leq -\frac{h_2}{h_1} e^{-ah_2} \left[ (x(t-h_1) - x(t-h(t))) \right]^T T_3 \left[ x(t-h_1) - x(t-h(t)) \right] + 3 \left[ x(t-h_1) + x(t-h(t)) - 2W_2(t) \right]^T T_3 \left[ x(t-h_1) + x(t-h(t)) - 2W_2(t) \right].$$
with

\[
\begin{align*}
V_1(0, x_0) &= x^T(0)P_1x(0) + 2h_2x^T(0)P_2\mathcal{W}_4^T(0) + h_2^2\mathcal{W}_4(0)P_3\mathcal{W}_4(0) \\
&\quad + 2h_2x^T(0)P_4\mathcal{W}_5(0) + 2h_2^2\mathcal{W}_5^T(0)P_5\mathcal{W}_5(0) \\
&\quad + h_2^2P_5\mathcal{W}_5^T(0)P_6\mathcal{W}_5(0), \\
V_2(0, x_0) &= \int_{-h_1}^{0} e^{\alpha s} x^T(s)Q_1x(s)ds, \\
V_3(0, x_0) &= \int_{-h_2}^{0} e^{\alpha s} x^T(s)Q_2x(s)ds,
\end{align*}
\]

Taking the assumption of activation functions (2.5) and (2.6) for any diagonal matrices $H_1, H_2, H_3 > 0$, it follows that

\[
\begin{align*}
2[f(t) - E_1 W x(t)]^T H_1 [D_1 W x(t) - f(t)] &\geq 0, \\
2[g_h(t) - E_2 W x(t - h(t))]^T H_2 [D_2 W x(t - h(t)) - g_h(t)] &\geq 0, \\
2[f(t) - g_h(t) - E(W x(t) - W x(t - h(t)))]^T H_3 &\geq 0.
\end{align*}
\]

Multiply (2.1) by $2Q x(t) + 2Q \dot{x}(t)^T$, we have the following identity:

\[
-2x^T(t)Q \dot{x}(t) - 2x^T(t)QA x(t) + 2x^T(t)QB f(t) + 2\dot{x}(t)QCg_h(t) \\
\quad -2\dot{x}(t)Q \dot{x}(t) - 2\dot{x}(t)QA x(t) + 2\dot{x}(t)QB f(t) + 2\dot{x}(t)QCg_h(t) = 0.
\]

From (3.10)–(3.18), it can be obtained

\[
\dot{V}(t, x_t) + \alpha V(t, x_t) \leq \varpi^T(t)[\Omega_1 + \Omega_2]\varpi(t),
\]

where $\Omega_1$ and $\Omega_2$ are given in Eqs (3.4) and (3.8). Since $\Omega_1 < 0$ and $\Omega_2 < 0$, $\dot{V}(t, x_t) + \alpha V(t, x_t) \leq 0$, then, we have

\[
\dot{V}(t, x_t) \leq -\alpha V(t, x_t), \quad \forall t \geq 0.
\]

Integrating both sides of (3.19) from 0 to $t$ with $t \in [0, T_f]$, we obtain

\[
V(t, x_t) \leq V(0, x_0)e^{-\alpha t}, \quad \forall t \geq 0.
\]
\[ V_4(0, x_0) = h_1 \int_{-h_1}^{h_1} \int_s^0 e^{\alpha_s \hat{x}^T(\delta)} R_1 \hat{x}(\delta) d\delta ds, \]
\[ V_5(0, x_0) = h_{21} \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_s^0 e^{\alpha_s \hat{x}^T(\delta)} R_2 \hat{x}(\delta) d\delta ds, \]
\[ V_6(0, x_0) = h_2 \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_s^0 e^{\alpha_s \hat{x}^T(\delta)} R_3 \hat{x}(\delta) d\delta ds, \]
\[ V_7(0, x_0) = \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_s^0 e^{\alpha_1(\delta+) \hat{x}^T(\delta) S_1 \hat{x}(\delta) d\delta ds dt, } \]
\[ V_8(0, x_0) = 2 \sum_{i=1}^{n} \int_{0}^{W_i x} W_i x \left[ \lambda_{11}(T_i^+ s - f_i(s)) + \lambda_{22}(f_i(s) - \sigma_i^+ s) \right] ds, \]
\[ V_9(0, x_0) = 2 \sum_{i=1}^{n} \int_{0}^{W_i x} W_i x \left[ \gamma_{11}(T_i^+ s - g_i(s)) + \gamma_{22}(g_i(s) - \eta_i^+ s) \right] ds, \]
\[ V_{10}(0, x_0) = \int_{-h_1}^{h_1} \int_s^0 \int_s^0 e^{\alpha_1(\delta+) \hat{x}^T(\delta) T_1 \hat{x}(\delta) d\delta ds dt \]
\[ + \int_{-h_1}^{h_1} \int_{-h_1}^{h_1} \int_s^0 e^{\alpha_1(\delta+) \hat{x}^T(\delta) T_2 \hat{x}(\delta) d\delta ds dt \]
\[ + \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_s^0 e^{\alpha_1(\delta+) \hat{x}^T(\delta) T_3 \hat{x}(\delta) d\delta ds dt \]
\[ + \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_s^0 e^{\alpha_1(\delta+) \hat{x}^T(\delta) T_4 \hat{x}(\delta) d\delta ds dt. } \]

Let \( I = M^1 M^{-1} = M^{1.5} M^{-1} \), \( \bar{P}_i = M^{-1.5} P_i M^{-1.5} \), \( i = 1, 2, 3, ..., 6, \)
\( \bar{Q}_j = M^{-1.5} Q_j M^{-1.5} \), \( j = 1, 2, \bar{R}_k = M^{-1.5} R_k M^{-1.5} \), \( k = 1, 2, 3, \bar{T}_l = M^{-1.5} T_l M^{-1.5}, l = 1, 2, 3, 4. \) Therefore,
\[ V(0, x_0) = x^T(0) M^1 \bar{P}_1 M^{1.5} x(0) + 2h_2 x^T(0) M^1 \bar{P}_2 M^{1.5} \bar{W}_4(0) + h_2^2 \bar{W}_4(0) M^1 \bar{P}_3 M^{1.5} \bar{W}_4(0) \]
\[ + 2h_2 x^T(0) M^1 \bar{P}_4 \bar{W}_4(0) + h_2^2 \bar{W}_4(0) M^1 \bar{P}_5 M^{1.5} \bar{W}_4(0) \]
\[ + h_2^2 \bar{P}_5 \bar{W}_4(0) M^1 \bar{P}_6 \bar{W}_5(0) + \int_{-h_1}^{0} e^{\alpha_1 x^T(\delta) M^1 \bar{Q}_1 M^{1.5} x(s)} ds \]
\[ + \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} e^{\alpha_1 x^T(\delta) M^1 \bar{R}_1 M^{1.5} \hat{x}(\delta) d\delta ds \]
\[ + h_{21} \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} e^{\alpha_1 x^T(\delta) M^1 \bar{R}_1 M^{1.5} \hat{x}(\delta) d\delta ds \]
\[ + h_2 \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} e^{\alpha_1 x^T(\delta) M^1 \bar{R}_2 M^{1.5} \hat{x}(\delta) d\delta ds \]
\[ + \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} \int_{-h_2}^{h_2} e^{\alpha_1 x^T(\delta) M^1 \bar{S}_M^1 \hat{x}(\delta) d\delta ds dt \]
\[ + 2[ L_1(D_1 W x^T(0)) - f(W x^T(0)) + L_2(f(W x^T(0)) - E_1 W x^T(0)) ] \]
\[ + 2[ G_1(D_2 W x^T(0)) - g(W x^T(0)) + G_2(g(W x^T(0)) - E_2 W x^T(0)) ] \]
\[
+ \int_{-h}^{0} \int_{-h}^{0} \int_{s}^{0} e^{\alpha(s+\tau)} \dot{x}(\tau) M^\dagger T_1 M^\dagger \dot{x}(\tau) d\tau dsd\tau \\
+ \int_{-h}^{0} \int_{-h}^{0} \int_{s}^{0} e^{\alpha(s+\tau)} \dot{x}(\tau) M^\dagger T_2 M^\dagger \dot{x}(\tau) d\tau dsd\tau \\
+ \int_{-h}^{0} \int_{-h}^{0} \int_{s}^{0} e^{\alpha(s+\tau)} \dot{x}(\tau) M^\dagger T_3 M^\dagger \dot{x}(\tau) d\tau dsd\tau \\
+ \int_{-h}^{0} \int_{-h}^{0} \int_{s}^{0} e^{\alpha(s+\tau)} \dot{x}(\tau) M^\dagger T_4 M^\dagger \dot{x}(\tau) d\tau dsd\tau,
\]

\[
\leq k_1 [\lambda_{\max}(\bar{P}_1) + 2\lambda_{\max}(\bar{P}_2) + \lambda_{\max}(\bar{P}_3) + 2\lambda_{\max}(\bar{P}_4) + 2\lambda_{\max}(\bar{P}_5) + \lambda_{\max}(\bar{P}_6) + N_1 \lambda_{\max}(\bar{Q}_1) + N_2 \lambda_{\max}(\bar{Q}_2) + h_1, N_3 \lambda_{\max}(\bar{R}_1) + h_{21}, N_4 \lambda_{\max}(\bar{R}_2) + h_{22}, N_5 \lambda_{\max}(\bar{R}_3) + N_6 \lambda_{\max}(\bar{S}) + 2\lambda_{\max}(\bar{L}_1) + 2\lambda_{\max}(\bar{L}_2) + 2\lambda_{\max}(\bar{G}_1) + 2\lambda_{\max}(\bar{G}_2) + N_7 \lambda_{\max}(\bar{T}_1) + N_8 \lambda_{\max}(\bar{T}_2) + N_9 \lambda_{\max}(\bar{T}_3) + N_{10} \lambda_{\max}(\bar{T}_4)].
\]

Since \(V(t, x_i) \geq V_1(t, x_i)\), we have
\[
V(t, x_i) \geq x^T(t) \bar{P}_i M x(t) + 2h_{2i} x^T(t) \bar{P}_i M \mathcal{W}_4(t) + \mathcal{W}_4^T(t) \bar{P}_i M \mathcal{W}_4(t) + 2h_{2i} x^T(t) \bar{P}_i M \mathcal{W}_5(t) + \mathcal{W}_5^T(t) \bar{P}_i M \mathcal{W}_5(t),
\]
\[
\geq \lambda_{\min}(\bar{P}_i) x^T(t) M x(t), \quad i = 1, 2, 3, 4, 5, 6.
\]

For any \(t \in [0, T_f]\), it follows that,
\[
x^T(t) M x(t) \leq \frac{k_1 e^{\alpha t}}{\lambda_{\min}(\bar{P}_i)} [\lambda_{\max}(\bar{P}_1) + 2\lambda_{\max}(\bar{P}_2) + \lambda_{\max}(\bar{P}_3) + 2\lambda_{\max}(\bar{P}_4) + 2\lambda_{\max}(\bar{P}_5) + \lambda_{\max}(\bar{P}_6) + N_1 \lambda_{\max}(\bar{Q}_1) + N_2 \lambda_{\max}(\bar{Q}_2) + h_1, N_3 \lambda_{\max}(\bar{R}_1) + h_{21}, N_4 \lambda_{\max}(\bar{R}_2) + h_{22}, N_5 \lambda_{\max}(\bar{R}_3) + N_6 \lambda_{\max}(\bar{S}) + 2\lambda_{\max}(\bar{L}_1) + 2\lambda_{\max}(\bar{L}_2) + 2\lambda_{\max}(\bar{G}_1) + 2\lambda_{\max}(\bar{G}_2) + N_7 \lambda_{\max}(\bar{T}_1) + N_8 \lambda_{\max}(\bar{T}_2) + N_9 \lambda_{\max}(\bar{T}_3) + N_{10} \lambda_{\max}(\bar{T}_4)] < k_2.
\]

This shows that the condition (3.9) holds. Therefore, the delayed neural network described by (2.1) and delay condition as in (2.2) is said finite-time stable with respect to \((k_1, k_2, T_f, h_1, h_2, M)\). \(\square\)

**Remark 10.** The condition (3.9) is not standard form of LMIIs. To verify that this condition is equivalent to the relation of LMI, it needs to apply Schur’s complement lemma in Lemma 3 and let \(\mathcal{B}_i\), \(i = 1, 2, 3, ..., 21\) be some positive scalars with
\[
\mathcal{B}_1 = \lambda_{\min}(\bar{P}_1), \quad i = 1, 2, 3, ..., 6, \\
\mathcal{B}_2 = \lambda_{\max}(\bar{P}_1), \quad \mathcal{B}_3 = \lambda_{\max}(\bar{P}_2), \quad \mathcal{B}_4 = \lambda_{\max}(\bar{P}_3), \quad \mathcal{B}_5 = \lambda_{\max}(\bar{P}_4), \\
\mathcal{B}_6 = \lambda_{\max}(\bar{P}_5), \quad \mathcal{B}_7 = \lambda_{\max}(\bar{P}_6), \quad \mathcal{B}_8 = \lambda_{\max}(\bar{Q}_1), \quad \mathcal{B}_9 = \lambda_{\max}(\bar{Q}_2), \\
\mathcal{B}_{10} = \lambda_{\max}(\bar{R}_1), \quad \mathcal{B}_{11} = \lambda_{\max}(\bar{R}_2), \quad \mathcal{B}_{12} = \lambda_{\max}(\bar{R}_3), \quad \mathcal{B}_{13} = \lambda_{\max}(\bar{S}), \\
\mathcal{B}_{14} = \lambda_{\max}(\bar{L}_1), \quad \mathcal{B}_{15} = \lambda_{\max}(\bar{L}_2), \quad \mathcal{B}_{16} = \lambda_{\max}(\bar{G}_1), \quad \mathcal{B}_{17} = \lambda_{\max}(\bar{G}_2), \\
\mathcal{B}_{18} = \lambda_{\max}(\bar{G}_3), \quad \mathcal{B}_{19} = \lambda_{\max}(\bar{G}_4), \quad \mathcal{B}_{20} = \lambda_{\max}(\bar{T}_1), \quad \mathcal{B}_{21} = \lambda_{\max}(\bar{T}_2).
\]
Let us define the following condition

\[
\mathcal{B}_1 = \lambda_{\max}(\bar{P}_1), \quad \mathcal{B}_2 = \lambda_{\max}(\bar{P}_2), \quad \mathcal{B}_3 = \lambda_{\max}(\bar{P}_3), \quad \mathcal{B}_4 = \lambda_{\max}(\bar{P}_4).
\]

It follows that condition (3.9) is equivalent to the relations and LMIs as follows:

\[
\mathcal{B}_1 I < \bar{P}_1 < \mathcal{B}_2 I, \quad 0 < \bar{P}_2 < \mathcal{B}_3 I, \quad 0 < \bar{P}_3 < \mathcal{B}_4 I, \quad 0 < \bar{P}_4 < \mathcal{B}_5 I,
\]

\[
0 < \bar{P}_5 < \mathcal{B}_6 I, \quad 0 < \bar{P}_6 < \mathcal{B}_7 I, \quad 0 < \bar{Q}_1 < \mathcal{B}_8 I, \quad 0 < \bar{Q}_2 < \mathcal{B}_9 I,
\]

\[
0 < \bar{R}_1 < \mathcal{B}_{10} I, \quad 0 < \bar{R}_2 < \mathcal{B}_{11} I, \quad 0 < \bar{R}_3 < \mathcal{B}_{12} I, \quad 0 < \bar{S} < \mathcal{B}_{13} I,
\]

\[
0 < L_1 < \mathcal{B}_{14} I, \quad 0 < L_2 < \mathcal{B}_{15} I, \quad 0 < G_1 < \mathcal{B}_{16} I, \quad 0 < G_2 < \mathcal{B}_{17} I,
\]

\[
0 < \bar{T}_1 < \mathcal{B}_{18} I, \quad 0 < \bar{T}_2 < \mathcal{B}_{19} I, \quad 0 < \bar{T}_3 < \mathcal{B}_{20} I, \quad 0 < \bar{T}_4 < \mathcal{B}_{21} I,
\]

\[
\bar{Q}_1 = \begin{bmatrix}
\phi_{1,1} & \phi_{1,2} & \phi_{1,3} \\
\ast & \phi_{2,2} & 0 \\
\ast & \ast & \phi_{3,3}
\end{bmatrix} < 0,
\]

\[
\phi_{1,1} = \begin{bmatrix}
\psi_{1,1} & \psi_{1,2} & \psi_{1,3} & \psi_{1,4} & \psi_{1,5} & \psi_{1,6} & \psi_{1,7} \\
\ast & -\mathcal{B}_2 & 0 & 0 & 0 & 0 & 0 \\
\ast & \ast & -\mathcal{B}_3 & 0 & 0 & 0 & 0 \\

* & * & * & * & * & -\mathcal{B}_{20} \\
* & * & * & * & * & * & -\mathcal{B}_{21}
\end{bmatrix},$$

(3.26)

where \( I \in \mathbb{R}^{n \times n} \) is an identity matrix, \( \psi_{i,1} = -\mathcal{B}_i k_2 e^{-\alpha T_f} \), \( \psi_{i,2} = \mathcal{B}_2 \sqrt{k_1} \), \( \psi_{i,3} = \mathcal{B}_3 \sqrt{2k_1} \), \( \psi_{i,4} = \mathcal{B}_4 \sqrt{k_1} \), \( \psi_{i,5} = \mathcal{B}_5 \sqrt{2k_1} \), \( \psi_{i,6} = \mathcal{B}_6 \sqrt{2k_1} \), \( \psi_{i,7} = \mathcal{B}_7 \sqrt{k_1} \), \( \psi_{i,8} = \mathcal{B}_8 \sqrt{k_1} \), \( \psi_{i,9} = \mathcal{B}_9 \sqrt{k_1} \), \( \psi_{i,10} = \mathcal{B}_{10} \sqrt{k_1} \), \( \psi_{i,11} = \mathcal{B}_{11} \sqrt{k_1} \), \( \psi_{i,12} = \mathcal{B}_{12} \sqrt{k_1} \), \( \psi_{i,13} = \mathcal{B}_{13} \sqrt{k_1} \), \( \psi_{i,14} = \mathcal{B}_{14} \sqrt{2k_1} \), \( \psi_{i,15} = \mathcal{B}_{15} \sqrt{2k_1} \), \( \psi_{i,16} = \mathcal{B}_{16} \sqrt{k_1} \), \( \psi_{i,17} = \mathcal{B}_{17} \sqrt{2k_1} \), \( \psi_{i,18} = \mathcal{B}_{18} \sqrt{k_1} \), \( \psi_{i,19} = \mathcal{B}_{19} \sqrt{k_1} \), \( \psi_{i,20} = \mathcal{B}_{20} \sqrt{k_1} \), \( \psi_{i,21} = \mathcal{B}_{21} \sqrt{k_1} \).

**Corollary 11.** Given a positive matrix \( M > 0 \), the time-delay system described by (2.1) and delay condition as in (2.2) is said finite-time stable with respect to \( (k_1, k_2, T_f, h_1, h_2, M) \), if there exist symmetric positive definite matrices \( Q_j > 0 \) \((i = 1, 2)\), \( R_j > 0 \) \((j = 1, 2, 3)\), \( K_l > 0 \) \((k = 1, 2, 3, 4)\), \( K_l > 0 \) \((l = 1, 2, 3, ..., 10)\), diagonal matrices \( S > 0 \), \( H_m > 0 \), \( M = 1, 2, 3 \), and matrices \( P_1 = P_1^T \), \( P_3 = P_3^T \), \( P_6 = P_6^T \), \( P_2, P_4, P_5 \) and positive scalars \( \alpha, \mathcal{B}_i \), \( i = 1, 2, 3, ..., 21 \) such that LMIs and inequalities (3.3)–(3.8), (3.20)–(3.26).

**Remark 12.** If the delayed NNs as in (2.1) are choosing as \( B = W_0, C = W_1, W = W_2 \), then the system turns into the delayed NNs proposed in [23],

$$\dot{x}(t) = -Ax(t) + W_0 f(W_2 x(t)) + W_1 g(W_2 x(t) - h(t)),$$

(3.27)

where \( 0 \leq h(t) \leq h_M \) and \( \dot{h}(t) \leq h_D \), it follows that (3.27) is the special case of the delayed NNs in (2.1).

**Remark 13.** Replacing \( W_0 = B, W_1 = C, W_2 = W, d_1(t) = d(t) = h(t) \) and \( d_2(t) = 0 \) and external constant input is equal to zero in Eq (1) of the delayed NNs as had been done in [16], we have

$$\dot{x}(t) = -Ax(t) + B f(W x(t)) + C g(W x(t) - h(t)),$$

(3.28)

then (3.28) is the same NNs as in (2.1) that (2.1) is the particular case of the delayed NNs in [16].

**Remark 14.** If we choose \( B = 0, C = 1 \) and \( g = f \) and constant input is equal to zero in the delayed NNs in (2.1), then it can be rewritten as

$$\dot{x}(t) = -Ax(t) + f(W x(t) - h(t)),$$

(3.29)

then (3.29) is the special case of the NNs as in (2.1) which has been done in [2–6, 10, 12, 13, 20].
Remark 15. If we set $B = W_0$, $C = W_1$ and $W = 1$ and constant input is equal to zero in the delayed NNs in (2.1), then (2.1) turns into

$$\dot{x}(t) = -Ax(t) + W_0f(x(t)) + W_1f_{g}x(t - h(t)),$$

(3.30)

then (3.30) is the special case of the NNs as in (2.1) which has been done in [8, 11, 24, 28]. Similarly, if we rearrange the matrices in the delayed NNs in (2.1) and set $W = 1$, it shows that it is the same delayed NNs proposed in [9, 19, 22].

Remark 16. The time delay in this work is defined as a continuous function serving on to a given interval that the lower and upper bounds for the time-varying delay exist and the time delay function is not necessary to be differentiable. In some proposed researches, the time delay function needs to be differentiable which are reported in [2–6, 8–13, 15–17, 19, 20, 22–24, 28].

4. Numerical solutions

In this section, we provide numerical examples with their simulations to demonstrate the effectiveness of our results.

Example 17. Consider the neural networks (2.1) with parameters as follows:

$$A = \text{diag}[7.3458, 6.9987, 5.5949], B = \text{diag}[0, 0, 0], C = \text{diag}[1, 1, 1],$$

$$W = \begin{bmatrix}
13.6014 & -2.9616 & -0.6938 \\
7.4736 & 21.6810 & 3.2100 \\
0.7290 & -2.6334 & -20.1300
\end{bmatrix}.$$ 

The activation function satisfies Eq (2.3) with

$$E_1 = E_2 = E = \text{diag}[0, 0, 0],$$

$$D_1 = D_2 = D = \text{diag}[0.3680, 0.1795, 0.2876].$$

By applying Matlab LMIs Toolbox to solve the LMIs in (3.4)–(3.8), we can conclude that the upper bound of $h_{\text{max}}$ without nondifferentiable $\mu$ of NNs in (2.1) which is shown in Table 1 is to compare the results of this paper with the proposed results in [1–7, 15, 20]. The upper bounds received in this work are larger than the corresponding ones. Note that the symbol ‘−’ represents the upper bounds which are not provided in those literatures and this paper.

The numerical simulation of finite-time stability for delayed neural network (2.1) with time-varying delay $h(t) = 0.6 + 0.5|\sin(t)|$, the initial condition $\phi(t) = [-0.8, -0.3, 0.8]$, we have $x^T(0)Mx(0) = 1.37$, where $M = I$ then we choose $k_1 = 1.4$ and activation function $g(x(t)) = \tanh(x(t))$. The trajectories of $x_1(t)$, $x_2(t)$ and $x_3(t)$ of finite-time stability for this network is shown in Figure 1. Otherwise, Figure 2 shows the trajectories of $x^T(t)x(t)$ of finite-time stability for delayed neural network (2.1) with $k_2 = 1.575$.

Figure 1. The trajectories of $x_1(t)$, $x_2(t)$ and $x_3(t)$ of finite-time stability for delayed neural network of Example 17.
Figure 2. The trajectories of $x^T(t)x(t)$ of finite-time stability for delayed neural network (2.1) with $k_2 = 1.575$ of Example 17.

**Example 18.** Consider the neural networks (2.1) with parameters as follows:

$$A = \text{diag}\{7.0214, 7.4367\}, B = \text{diag}\{0, 0\}, C = \text{diag}\{1, 1\},$$

$$W = \begin{bmatrix} -6.4993 & -12.0275 \\ -0.6867 & 5.6614 \end{bmatrix}.$$  

The activation function satisfies Eq (2.3) with

$$E_1 = E_2 = E = \text{diag}\{0, 0\},$$

$$D_1 = D_2 = D = \text{diag}\{1, 1\}.$$  

As shown in Table 2, the results of the obtained as in [2,3,5,6,20] and this work, by using Matlab LMIs Toolbox, we can summarize that the upper bound of $h_{\text{max}}$ is differentiable $\mu$ of NNs in (2.1). We can see that the upper bounds received in this paper are larger than the corresponding purposed. Similarly, the symbol ‘–’ represents the upper bounds which are not given in those proposed and this study.

The numerical simulation of finite-time stability for delayed neural network (2.1) with time-varying delay $h(t) = 0.6 + 0.5|\sin t|$, the initial condition $\phi(t) = [-0.4, 0.5]$, we have $x^T(0)Mx(0) = 0.41$, where $M = I$ then we choose $k_1 = 0.5$ and activation function $g(x(t)) = \tanh(x(t))$. The trajectories of $x_1(t)$ and $x_2(t)$ of finite-time stability for this network is shown in Figure 3. Otherwise, Figure 4 shows the trajectories of $x^T(t)x(t)$ of finite-time stability for delayed neural network (2.1) with $k_2 = 0.85$.

**Figure 3.** The trajectories of $x_1(t)$ and $x_2(t)$ of finite-time stability for delayed neural network of Example 18.
Figure 4. The trajectories of $x^T(t)x(t)$ of finite-time stability for delayed neural network (2.1) with $k_2 = 0.85$ of Example 18.

**Example 19.** Consider the neural networks (2.1) with parameters as follows:

$$A = \begin{bmatrix} 1.7 & -1.7 & 0 \\ -1.3 & 1 & -0.7 \\ -0.7 & -1 & 0.6 \end{bmatrix}, \quad B = \begin{bmatrix} 1.5 & -1.7 & 0.1 \\ -1.3 & 1 & -0.5 \\ -0.7 & 1 & 0.6 \end{bmatrix}, \quad C = \begin{bmatrix} 0.5 & -0.7 & 0.1 \\ -0.3 & 0.1 & -0.5 \\ -0.7 & 0.5 & 0.6 \end{bmatrix},$$

$$W = I,$$

and the activation function $f(x(t)) = g(x(t)) = \tanh(x(t))$, the time-varying delay function satisfying $h(t) = 0.6 + 0.5|\sin t|$. With an initial condition $\phi(t) = [0.4, 0.2, 0.4]$, the solution of the neural networks is shown in Figure 5. We can see that the trajectory of $x^T(t)Mx(t) = ||x(t)||^2$ diverges as $t \to \infty$ is shown in Figure 6. To further investigate the maximum value of $T_f$ that the finite-time stability of the neural networks (2.1) with respect to $(0.6, k_2, T_f, 0.6, 1.1, I)$. For fixed $k_2 = 500$, by solving the LMIs in Theorem 9 and Corollary 11, we have the maximum value of $T_f = 8.395$.

5. Conclusions

In this research, the finite-time stability criterion for neural networks with time-varying delays were proposed via a new argument based on the Lyapunov-Krasovskii functional (LKF) method was proposed with non-differentiable time-varying delay. The new LKF was improved by including triple integral terms consisting of improved functionality of finite-time stability, including integral inequality and implementing a positive diagonal matrix without a free weighting matrix. The
improved finite-time sufficient conditions for the neural network with time varying delay were estimated in terms of linear matrix inequalities (LMIs) and the results were better than reported in previous research.
