Abstract: This paper deals with localized waves in the (2+1)-dimensional Caudrey-Dodd-Gibbon-Kotera-Sawada (CDGKS) equation in the incompressible fluid. Based on Hirota’s bilinear method, N-soliton solutions related to CDGKS equation are constructed. Taking the special reduction, the exact expression of multiple localized wave solutions comprising lump soliton(s) are obtained by using the long wave limit method. A variety of interactions are illustrated analytically and graphically. The influence of parameters on propagation is analyzed and summarized. The results and phenomena obtained in this paper enrich the dynamic behavior of the evolution of nonlinear localized waves.

Keywords: bilinear operator; long wave limit; lump soliton; periodic soliton; interaction

Mathematics Subject Classification: 35Q51, 37K40

1. Introduction

Generally, it has always been a vital task to solve soliton equation based on the soliton theory. Except for numerical calculation and computer simulation, the mainstream research has been focused on finding the exact solution of the soliton equation. Seeking the exact solution of soliton equation possesses significant value from both theoretical and practical perspectives, which not only helps to further understand the essential properties and algebraic structure of the soliton equation, but also can explain related natural phenomenon reasonably. With the rapid development of soliton theory, many systematic methods have been proved effective, such as the inverse scattering method [1, 2], Riemann-Hilbert problem [3], Bäcklund transformation [4, 5], Darboux transformation [6–8], Hirota bilinear method [9, 10], Wronskian technique [11], KP reductions [12], Painlevé analysis [13, 14] and algebra-geometric method [15–17] etc. Among these methods, Hirota bilinear method uses the bilinear derivative as a tool and it is only related to the equation to be solved and independent on the spectral
problem of the equation or the Lax pair. As a result, Hirota bilinear method is featured as intuitive and straightforward, which has become a common method to solve several multiple solition solutions of nonlinear evolution equations [18–24]. Many researchers have been working on various extensions and applications of bilinear methods, which further develops and broadens bilinear methods [25–28]. For instance, by using bilinear method, Ma et al. [29–31] studied lump solutions and interaction solutions to integrable equations.

In this paper, we will focus on the following (2+1)-dimensional Caudrey-Dodd-Gibbon-Kotera-Sawada (CDGKS) equation [32]:

\[
36u_t + u_{5x} + 15(uu_{xx})_x + 45u^2u_x - 5uu_{xy} - 15uu_x\partial_x^{-1}u_y - 5\partial_x^{-1}u_{yy} = 0, \tag{1.1}
\]

where \( u = u(x, y, t) \) is a differentiable function with the scaled space variables \( x, y \) and time variable \( t \), and the operator \( \partial_x^{-1} \) is the inverse operator of \( \partial_x \). When \( u_y = 0 \), Eq (1.1) reduces to the (1+1)-dimensional CDGKS equation. The CDGKS equation is derived by Sawada and Kotera [33], also by Caudrey, Dodd and Gibbon [34,35] independently, so it is also called Sawada-Kotera (SK) equation. The CDGKS equation is one of the most important integrable equations in soliton theory for describing a large range of nonlinear dispersive physical phenomena, and widely applied in nonlinear sciences such as the conservative flow of Liouville equation, 2-dimensional gauge field theory of quantum gravity and theory of conformal field etc. [34, 36].

The (2+1)-dimensional CDGKS equation is a first member in the BKP integrable hierarchy [37–39], which is a higher-order generalization of the celebrated nonlinear evolution equation. Recently, CDGKS equation has attracted the attentions of many researchers, and delicate works have been conducted to solve the equation. Geng [40] using the Riccati equation and the invariance of the transformation of the independent variables, Darboux transformations of the (2+1)-dimensional CDGKS equation and the CDGKS equation are constructed. As an application, rational solutions and soliton solutions of these two equations are obtained by means of the Darboux transformations. Cao et al. [41] used the Lax methods to reduce the equation to integrability ordinary different equation and got the quasi period solution. By applying Painlevé expansion method and extended homoclinic test approach, Wang and Xian [42] obtained the homoclinic breather-wave solutions, periodic wave solutions and kink solitary wave solutions for Eq (1.1). In [43], new non-travelling wave solutions of (2+1)-dimensional CDGKS equation were derived by combining the Lie point group method to proper non-linear travelling wave method, and moreover, the localized structures were discussed. Geng et al. [44] obtained the Riemann theta function solutions of the CDGKS equation. The other solutions to Eq (1.1) including rational solutions and triangular periodic solutions, quasi-periodic solutions and novel periodic solitary wave have been derived by tanh method, Darboux transformation and Hirota bilinear method, respectively [45–50].

Up to now, there are few results about different soliton interaction solutions of the (2+1)-dimensional CDGKS equation, such as the interaction between line soliton and periodic soliton, the interaction between line soliton and lump soliton and the interaction between periodic soliton and lump soliton. By using Hirota bilinear method, Ref. [51] investigated the interactions among different kinds of single solitary wave, such as line-line, line-lump, lump-lump, etc. Due to the lump soliton is the periodically infinite increment of periodic soliton, in other words, it is derived by taking the limit of periodic soliton. The interactions among soliton solutions became more complicated with high order of the solution, which will be discussed in detail in this paper.
2. $N$-soliton solution of (2+1)-dimensional CDGKS equation

Bilinear form of Eq (1.1) has been obtained via the dependent variable transformation

$$u = 2(\ln g)_{xx},$$

which could be written as

$$(5D_x(D_x^2 + D_y) - D_x(D_x^2 + 36D_t))(g \cdot g) = 0.$$  

(2.2)

Based on the Hirota’s bilinear theory, Eq (1.1) has standard $N$-soliton solution by Eqs (2.1)-(2.2), and the solution of Eq (2.2) is in the form of

$$g_N = \sum_{\mu=0,1} \exp\left(\sum_{i=1}^{N} \mu_i \eta_i + \sum_{1 \leq i < j} \mu_i \mu_j \ln(A_{ij})\right),$$

(2.3)

where

$$\eta_i = a_i x + b_i y + c_i t + \eta_{0i}, \quad c_i = -\frac{5a_i^3 b_i + 5b_i^2 - a_i^6}{36a_i},$$

$$A_{ij} = \frac{(a_i - a_j)^6 - 5(a_i - a_j)^3(b_i - b_j) + 36(a_i - a_j)(c_i - c_j) - 5(b_i - b_j)^2}{(a_i + a_j)^6 - 5(a_i + a_j)^3(b_i + b_j) + 36(a_i + a_j)(c_i + c_j) - 5(b_i + b_j)^2},$$

with $a_i, b_i, c_i$ and $\eta_{0i} (i = 1, 2, \ldots, N)$ any arbitrary constants, and $\sum_{\mu=0,1}$ summation total of taking over all possible combinations of $\eta_i, \eta_j = 0, 1 (i, j = 1, 2, 3, \ldots, N)$. Based on the work of [26,52], the following theorem is proposed.

**Theorem 1.** Let $b_k = q_k a_k (k = 1, \cdots, N), a_j = l_j e^i, \exp(\eta_{0j}^*) = -1 (j = 1, \cdots, 2M), q_n = a_n^{**M} (n = 1, \cdots, M)'^{*}$ is conjugate), $d_{2M+l} = a_{2M+l}^{*}, (l = 1, \cdots, P)$ and $a_{2M+2P+h} (h = 1, \cdots, Q)$ are real constants, when $\epsilon \to 0$, the $N$-soliton solution $u$ of Eq (2.1) with (2.3) can reduce to the interaction solutions of $M$-lump, $P$-breather and $Q$-line soliton, where $N = 2M + 2P + Q$, in which $M, P, Q$ are nonnegative integers and express the numbers of lump, breather and line soliton, respectively.

3. The solutions comprising one lump soliton

3.1. The case of Theorem 1 with $M = 1, 2P + Q = 3$

To construct interaction solutions comprising one lump soliton satisfying the condition, the parameters in Eq (2.3) need to satisfy the following conditions

$$b_i = a_i q_i (i = 1, 2, \cdots, 5), a_1 = l_1 e^i, a_2 = l_2 e^i, \eta_{01} = \eta_{02} = i \pi, \eta_{03} = \eta_{04} = \eta_{05} = 0,$$

and take the long wave limit as $\epsilon \to 0$ in five-soliton solution, then we have

$$g = (q_1 q_2 + d_{12}) l_1 l_2 e^2 + \sum_{j=3}^{5} (q_j q_2 + d_{2j} q_1 + d_{1j} q_2 + d_{12} + d_{1j} d_{2j}) \exp(\eta_j) l_1 l_2 e^2$$
Inserting Eqs (3.1)-(3.4) into Eq (2.1), the solution of Eq (1.1) can be obtained.

\[ + \sum_{3 \leq j \leq k} d_{jk} (q_1 q_2 + (d_{2j} + d_{2k}) q_1 + (d_{1j} + d_{1k}) q_2 + d_{12} + (d_{1j} + d_{1k})(d_{2j} + d_{2k})) \]

\[ \cdot \exp(\eta_j + \eta_k) l_1 l_2 e^2 + \prod_{3 \leq j < k} d_{jk} (q_1 q_2 + \sum_{s=3}^{(5)} (d_{2s} q_1 + d_{1s} q_2) + d_{12} + \sum_{s=3}^{(5)} d_{1s} \sum_{s=3}^{(5)} d_{2s}) \]

\[ \cdot \exp(\sum_{s=3}^{(5)} \eta_s) l_1 l_2 e^2 + O(e^3), \]  

\[ (3.1) \]

with

\[ q_i = x + q_i y + \frac{5}{36} q_i^2 t \ (i = 1, 2), d_{12} = \frac{6(q_1 + q_2)}{(q_1 - q_2)^2}, \]  

\[ (3.2) \]

\[ d_{sj} = -\frac{6a_j(a_j^2 - q_s - q_j)}{a_j^2 - (q_s + 2q_j)a_j^2 + (q_s - q_j)^2} \ (s = 1, 2, j = 3, 4, 5), \]  

\[ (3.3) \]

\[ d_{sj} = \frac{M}{N}, \ (3 \leq s < j \leq 5), \]  

\[ (3.4) \]

where

\[ M = a_4^4 - 3a_3^3a_j + (4a_j^2 - 2q_j - q_s - q_j)a_s^2 - 3a_j(a_j^2 - q_s - q_j)a_s + a_j^4 - (q_s + 2q_j)a_j^2 + (q_s - q_j)^2, \]

\[ N = a_4^4 + 3a_3^3a_j + (4a_j^2 - 2q_j - q_s - q_j)a_s^2 + 3a_j(a_j^2 - q_s - q_j)a_s + a_j^4 - (q_s + 2q_j)a_j^2 + (q_s - q_j)^2. \]

Inserting Eqs (3.1)-(3.4) into Eq (2.1), the solution of Eq (1.1) can be obtained.

(i) In the special case of \( P = 0, Q = 3 \).

If taking

\[ q_1 = q_2^* = -\frac{1}{3} - 2i, q_3 = -\frac{3}{2}, q_4 = -\frac{3}{4}, q_5 = \frac{1}{3}, a_3 = -\frac{4}{5}, a_4 = \frac{4}{5}, a_5 = \frac{3}{2}, \]

the solution \( u \) given by Eq (3.1) expresses the interaction among a lump soliton and three bell-shaped line solitons. Figure 1 presents the interaction behavior between three bell-shaped line solitons and a lump soliton in Eq (3.1) at different time. It can be observed that the lump spreads together with the three bell-shaped line solitons. During the interaction process, we can find that the shape and velocity of three bell-shaped line solitons and lump remain unchanged, which exhibit the characteristic of "elastic collision".

(ii) In the special case of \( P = 1, Q = 1 \).

If taking

\[ q_1 = q_2^* = -\frac{1}{3} - 2i, q_3 = q_4^* = -\frac{1}{4} - \frac{1}{2} i, q_5 = 1, a_3 = a_4 = -\frac{1}{5}, a_5 = \frac{3}{4}, \]

in Eq (3.1), Figure 2 presents the interaction behavior between one lump, one breather and one bell-shaped line soliton. The period of the breather is \( 20\pi \) along the \( y \) direction. It can be observed that the lump spreads together with the breather and line soliton. During the interaction process, the shape and velocity of the lump and line soliton remain unchanged, the period of the breather remain unchanged.
Figure 1. Three-dimensional plots and density plots of the interaction solution for Eq (3.1) at different time with parameters: $q_1 = q_2^* = -\frac{1}{3} - 2i, q_3 = -\frac{7}{3}, q_4 = \frac{1}{3}, a_3 = -\frac{4}{3}, a_4 = \frac{4}{3}, a_5 = \frac{3}{2}$.

Figure 2. Three-dimensional plots and density plots of the interaction solution for Eq (3.1) at different time with parameters: $q_1 = q_2^* = -\frac{1}{3} - 2i, q_3 = q_4^* = -\frac{1}{3} - \frac{1}{2}i, q_5 = 1, a_3 = a_4 = -\frac{1}{3}, a_5 = \frac{3}{2}$.

3.2. The case of Theorem 1 with $M = 1, 2P + Q = 4$

To construct interaction solutions comprising one lump soliton satisfying the condition, the parameters in Eq (2.3) need to satisfy the following conditions

$$b_i = a_i q_i \quad (i = 1, 2, \ldots, 6), a_1 = l_1 \varepsilon, a_2 = l_2 \varepsilon, \eta_{01} = \eta_{02} = i \pi, \eta_{03} = \eta_{04} = \eta_{05} = \eta_{06} = 0,$$

and take the long wave limit as $\varepsilon \to 0$ in the function $g$ in Eq (2.3), then

$$g = (q_1 q_2 + d_{12}) l_1 l_2 \varepsilon^2 + \sum_{j=3}^{6} (q_1 q_2 + d_{2j} q_1 + d_{1j} q_2 + d_{12} + d_{1j} d_{2j}) \exp(\eta_j) l_1 l_2 \varepsilon^2$$

$$+ \sum_{3 \leq j < k} d_{jk} [q_1 q_2 + (d_{2j} + d_{2k}) q_1 + (d_{1j} + d_{1k}) q_2 + d_{12} + (d_{1j} + d_{1k})(d_{2j} + d_{2k})]$$

$$\cdot \exp(\eta_j + \eta_k) l_1 l_2 \varepsilon^2 + \sum_{3 \leq j < k < s} d_{jk} d_{js} [q_1 q_2 + (d_{2j} + d_{2k} + d_{2s}) q_1 + (d_{1j} + d_{1k} + d_{1s})(d_{2j} + d_{2k} + d_{2s})] \exp(\eta_j + \eta_k + \eta_s) l_1 l_2 \varepsilon^2$$
\[ + \prod_{3 \leq j < k} \delta_{jk}[\varrho_1 q_2 + \sum_{s=3}^{(6)} (d_{2s} q_1 + d_{1s} q_2) + d_{12} + \sum_{s=3}^{(6)} d_{1s} \sum_{s=3}^{(6)} a_{2s}] \exp(\sum_{s=3}^{(6)} \eta_s) l_1 l_2 e^2 + O(e^3), \]

(3.5)

where

\[ \varrho_i = x + q_i y + \frac{5}{36} q_i^2 t, \quad (i = 1, 2), \]

(3.6)

\[ d_{12} = \frac{6(q_1 + q_2)}{(q_1 - q_1)^2}, \]

(3.7)

\[ d_{sj} = -\frac{6a_j(a_j^2 - q_s - q_j)}{a_j^2 - (q_s + 2q_j)a_j^2 + (q_s - q_j)^2} \quad (s = 1, 2, j = 3, 4, 5, 6), \]

(3.8)

\[ d_{sj} = \frac{M}{N}, \quad (3 \leq s < j \leq 6), \]

(3.9)

where

\[ M = a_j^4 - 3a_j^2a_j + (4a_j^2 - 2q_s - q_j)a_s^2 - 3a_j(a_j^2 - q_s - q_j)a_s + a_j^4 - (q_s + 2q_j)a_s^2 + (q_s - q_j)^2, \]

\[ N = a_s^4 + 3a_s^2a_s + (4a_s^2 - 2q_s - q_j)a_s^2 + 3a_s(a_s^2 - q_s - q_j)a_s + a_s^4 - (q_s + 2q_j)a_s^2 + (q_s - q_j)^2. \]

Inserting Eqs (3.5)-(3.9) into Eq (2.1), the solution of Eq (1.1) can be obtained.

(i) In the special case of \( P = 0, Q = 4 \).

If taking

\[ q_1 = q_2^* = -1 - 2i, q_3 = -\frac{3}{2}, q_4 = -\frac{3}{4}, q_5 = 1, q_6 = \frac{2}{3}, a_3 = a_4 = 1, a_5 = a_6 = \frac{5}{4}, \]

the solutions \( u \) given by Eq (3.5) express the elastic interaction between one lump and four bell-shaped solitons at different time as shown in Figure 3.

(ii) In the special case of \( P = 1, Q = 2 \).

In Eq (3.5), if taking

\[ q_1 = q_2^* = -1 + 2i, q_3 = q_4^* = -\frac{4}{3}i, q_5 = -\frac{3}{4}, q_6 = \frac{3}{4}, a_3 = a_4 = \frac{1}{3}, a_5 = a_6 = 1, \]

the solution of Eq (1.1) corresponds to the interaction behavior among one lump, one breather and two bell-shaped line solitons, as shown in Figure 4.

(iii) In the special case of \( P = 2, Q = 0 \).

If taking

\[ q_1 = q_2^* = -1 - 3i, q_3 = q_4^* = -1 - \frac{4}{3}i, q_5 = q_6^* = -\frac{1}{7} - \frac{1}{2}i, a_3 = a_4 = \frac{1}{8}, a_5 = a_6 = \frac{1}{5}, \]
the solutions $u$ given by Eq (3.5) express the elastic interaction between one lump and two breather solitons at different time as shown in Figure 5.

**Figure 3.** The interaction among one lump soliton and four line solitons with parameters: $q_1 = q_2^* = -1 - 2i, q_3 = -\frac{3}{2}, q_4 = -\frac{3}{2}, q_5 = 1, q_6 = \frac{3}{2}, a_3 = a_4 = 1, a_5 = a_6 = \frac{3}{4}$.

**Figure 4.** Three-dimensional plots and density plots of the interaction solution for Eq (3.5) at different time with parameters: $q_1 = q_2^* = -1 + 2i, q_3 = q_4^* = -\frac{3}{2}i, q_5 = -\frac{1}{2}, q_6 = \frac{1}{2}, a_3 = a_4 = \frac{1}{3}, a_5 = a_6 = 1$.

**Figure 5.** The interaction among one lump soliton and two breather solitons with parameters: $q_1 = q_2^* = -1 - 3i, q_3 = q_4^* = -1 - \frac{3}{2}i, q_5 = q_6^* = -\frac{1}{4} - \frac{1}{4}i, a_3 = a_4 = \frac{1}{4}, a_5 = a_6 = \frac{1}{4}$.
4. The solutions comprising two lump solitons

4.1. The case of Theorem 1 with $M = 2, P = 0, Q = 1$

To construct interaction solutions comprising two lump solitons satisfying the condition, the parameters in Eq (2.3) need to satisfy the following conditions

$$b_i = a_i q_i, a_i = l_i e \quad (i = 1, 2, 3, 4), \quad b_5 = a_5 q_5, \eta_{01} = \eta^{*}_{02} = \eta_{03} = \eta^{*}_{04} = i \pi, \eta_{05} = 0,$$

and take the long wave limit as $\varepsilon \to 0$ in five-soliton solution, we can obtain

$$g = \left( \prod_{j=1}^{4} \varrho_j \right) + \sum_{1 \leq j < k \leq s}^{(4)} d_{s} \prod_{j}^{4} \varrho_{k} + \sum_{1 \leq j < k, l \leq s}^{(4)} d_{j} d_{k} l_{1} l_{2} l_{3} \varepsilon^{4} + \left\{ \prod_{j=1}^{4} \varrho_{j} \right\}$$

$$+ \sum_{j=1}^{(4)} d_{j} \prod_{k \neq j}^{4} \varrho_{k} + \sum_{j \neq k, s \leq m \leq j}^{(4)} \varrho_{j} \varrho_{k} (d_{s} d_{m} + a_{s m}) + \sum_{j \neq k, s \leq m \leq j}^{(4)} \varrho_{j} (d_{k} a_{m}$$

$$+ \sum_{s \leq k \leq s}^{(4)} d_{1} a_{k s} + \sum_{s \leq m, k \leq s}^{(4)} d_{s} d_{m} d_{s} d_{k n} + \sum_{i=1}^{4} d_{i} \varepsilon^{4} \exp(\eta_{5})$$

$$\times l_{1} l_{2} l_{3} l_{4} \varepsilon^{4} + O(\varepsilon^{5}), \quad (4.1)$$

where

$$\varrho_{i} = x + q_{i} y + \frac{5}{36} q_{i}^{2} t \quad (i = 1, 2, 3, 4), \quad (4.2)$$

$$d_{s j} = \frac{6(q_{s} + q_{j})}{(q_{s} - q_{j})^{2}} \quad (1 \leq s < j \leq 4), \quad (4.3)$$

and

$$d_{s} = \frac{6a_{s}(a_{s}^{2} - q_{s} - q_{s})}{a_{s}^{2} - (q_{s} + 2q_{s})a_{s} + (q_{s} - q_{s})^{2}} \quad (s = 1, 2, 3, 4). \quad (4.4)$$

Inserting Eqs (4.1)-(4.4) into Eq (2.1), the solution of Eq (1.1) can be obtained. If taking

$$q_{1} = q^{*}_{2} = -\frac{1}{3} - 2i, q_{3} = q^{*}_{4} = -\frac{1}{2} - i, q_{5} = \frac{2}{5}, a_{5} = \frac{3}{4},$$

the solutions $u$ given by Eq (4.1) express the elastic interaction between two lump solitons and one bell-shaped line soliton at different time as shown in Figure 6. With the evolution of time, the two lump solitons move along the positive $x$-axis, and the line soliton moves along the negative $x$-axis. After elastic collision, the two lump solitons pass through the line soliton, and switch their positions.
Figure 6. The interactions among two lump solitons and a line soliton at different time with parameters: $q_1 = q_2^* = -\frac{1}{2} - 2i, q_3 = q_4^* = -\frac{1}{2} - i, q_5 = \frac{2}{3}, a_5 = \frac{3}{2}$.

4.2. The case of Theorem 1 with $M = 2, 2P + Q = 2$

To construct interaction solutions comprising two lump solitons satisfying the condition, the parameters in Eq (2.3) need to satisfy the following conditions

$$b_i = a_i q_i (i = 1, 2, \cdots , 6), a_k = l_k e(k = 1, 2, 3, 4), \eta_{01} = \eta_{02} = \eta_{03} = \eta_{04} = i\pi, \eta_{05} = \eta_{06} = 0,$$

and take the long wave limit as $\varepsilon \to 0$ in six-soliton solution, we can obtain

$$g = \left( \prod_{1 \leq s < j} q_j + \sum_{k \neq s, k < m} d_{sk} q_k + \sum_{s \neq s' \neq m, s < k < m} d_{sk} d_{s'm} q_{k}s \right) l_1 l_2 l_3 l_4 \varepsilon^4 + \sum_{w=5}^{6} \left( \prod_{j=1}^{4} q_j \right)$$

$$+ \sum_{j=1}^{4} d_{sw} \left[ \prod_{k \neq j} q_k + \sum_{j < k, s < k \neq m} q_j q_k \left( d_{sw} d_{mv} + d_{sm} \right) + \sum_{j < k \neq s, s \neq k \neq m} q_j \left[ \left( d_{sk} d_{s'm} \right) d_{sm} \right] \right]$$

$$+ \sum_{n \neq j}^{4} d_{nw} + \sum_{s \neq m, s < k < m} d_{sk} d_{km} + \sum_{s < m, k < n \neq m} d_{sw} d_{mv} d_{kn} + \sum_{n=1}^{4} \left( \prod_{j=1}^{4} q_j \right)$$

$$\times l_1 l_2 l_3 l_4 \varepsilon^4 + d_{s5} \left[ \prod_{j=1}^{4} q_j + \sum_{j=1}^{4} \left( d_{s5} + d_{s6} \right) \prod_{k \neq j} q_k + \sum_{j < k, s < m, s \neq m} q_j q_k \left( d_{s6} \right) \right]$$

$$+ d_{s6} \left( d_{s5} + d_{s6} \right) + d_{sm} \right] + \sum_{j < k \neq s, s \neq k} q_j d_{sk} \left( d_{s5} + d_{s6} \right) + \sum_{n=1}^{4} \left( d_{s5} + d_{s6} \right)$$

$$+ \sum_{s \neq m, s < k < m} d_{sk} d_{km} + \sum_{s < m, k < n \neq m} d_{sw} d_{mv} d_{kn} + \sum_{n=1}^{4} \left( d_{s5} + d_{s6} \right)$$

$$\times \exp \left( \eta_5 + \eta_6 \right) l_1 l_2 l_3 l_4 \varepsilon^4 + O(\varepsilon^5),$$

\[ (4.5) \]
where

\[ \varrho_i = x + q_i y + \frac{5}{36} q_i^2 t \quad (i = 1, 2, 3, 4), \quad (4.6) \]

\[ d_{sj} = \frac{6(q_s + q_j)}{(q_s - q_j)^2} \quad (1 \leq s < j \leq 4), \quad (4.7) \]

and

\[ d_{sj} = -\frac{6a_j(a_j^2 - q_s - q_j)}{a_j^4 - (q_s + 2q_j)a_j^2 + (q_s - q_j)^2} \quad (s = 1, 2, 3, 4, \quad j = 5, 6), \quad (4.8) \]

\[ d_{56} = \frac{M}{N}, \quad (4.9) \]

where

\[ M = a_5^3 - 3a_3^2a_6 + (4a_6^2 - 2q_5 - q_6)a_3^2 - 3a_6(a_5^2 - q_5 - q_6)a_5 + a_6^4 - (q_5 + 2q_6)a_6^2 + (q_5 - q_6)^2, \]
\[ N = a_4^3 + 3a_3^2a_6 + (4a_6^2 - 2q_5 - q_6)a_3^2 - 3a_6(a_5^2 - q_5 - q_6)a_5 + a_6^4 - (q_5 + 2q_6)a_6^2 + (q_5 - q_6)^2. \]

Inserting Eqs (4.5)-(4.9) into Eq (2.1), the solution of Eq (1.1) can be obtained.

(i) In the special case of \( P = 0, Q = 2 \).

If taking

\[ q_1 = q_2^* = -1 - 2i, \quad q_3 = q_4^* = -\frac{1}{4} - 3i, \quad q_5 = \frac{2}{3}, \quad q_6 = 2, \quad a_5 = a_6 = -\frac{6}{5}, \]

the solutions \( u \) given by Eq (4.5) express the elastic interaction between two lump and two bell-shaped line solitons at different time as shown in Figure 7.

(ii) In the special case of \( P = 1, Q = 0 \).

If taking

\[ q_1 = q_2^* = -3 - 3i, \quad q_3 = q_4^* = -1 - 2i, \quad q_5 = q_6^* = -1 - i, \quad a_5 = a_6 = -\frac{1}{4}, \]

the solutions \( u \) given by Eq (4.5) express the elastic interaction between two lump solitons and one breather soliton, the period of the breather is \( 8\pi \) along the \( y \) direction, as shown in Figure 8.
5. The interactions solutions among three lumps

In the special case of Theorem 1 with $M = 3, P + Q = 0$, we obtain the interaction solution among three lumps. About the pure lumps solution, there have the following result [9]:

**Corollary 1.** In (2.3), setting $N = 2M, b_k = q_k a_k(k = 1, \cdots, N), a_j = \exp(\eta_0^j) = -1$ $(j = 1, \cdots, 2M)$, $q_n = q_{n+M}^n(n = 1, \cdots, M)$, when $\epsilon \to 0$, the $N$-soliton solution of Eq (1.1) can reduce to the interaction solutions of $M$-lump [53, 54]. The expression can be obtained by (2.1) with

$$g_{2M} = \prod_{j=1}^{2M} q_j + \frac{1}{2} \sum_{s,j}^{2M} d_{sj} \prod_{l \neq s,j}^{2M} q_l + \frac{1}{2!2^2} \sum_{s,j,k,m}^{2M} \prod_{l \neq s,j,k,m}^{2M} q_l + \cdots$$

$$+ \frac{1}{M!2^M} \sum_{s,j,k,m}^{2M} d_{sj} d_{ti} \cdots d_{vn} \prod_{p \neq s,j,i,\ldots,n}^{2M} q_p + \cdots,$$

(5.1)

where $g_s$ and $d_{sj}$ meet following requirements,

$$q_j = x + q_j y + \frac{5}{36} q_j^2 t, \quad (s = 1, 2, \cdots, 2M),$$

(5.2)

and

$$d_{sj} = \frac{6(q_s + q_j)}{(q_s - q_j)^2} \quad (1 \leq s < j \leq 2M),$$

(5.3)

where $j, s$ are positive integers, $m$ is arbitrary complex constant. When $M = 3$, the solution of Eq (1.1) corresponds to interaction among three lump solitons.

In the followings, the large time asymptotic behaviors of the three lumps solution are analyzed. Fixing the modulus of a phase function, e.g. $|q_1|^2 = \text{constant}$, considering the limit of $t \to \pm \infty$, $q_2, q_3, q_5 = O(t)$ and $q_2 q_5^* = O(t^2), q_2 q_3^* = O(t^2)$, function $g$ has the following asymptotic states

$$g \sim |q_1|^2 |q_2|^2 |q_3|^2 + d_{14} |q_2|^2 |q_3|^2.$$

(5.4)
Considering the properties of bilinear transformation of CDGKS equation, the function \( g \) in Eq. (5.4) can be further equivalent to

\[
g \sim |\varphi_1|^2 + d_{14}.
\] (5.5)

If \( |\varphi_2|^2 \) = constant or \( |\varphi_3|^2 \) = constant, similar conclusion to Eq (5.5) can be obtained. Thus, in the limit of \( t \to \pm \infty \), the three lumps solution tends to become three single lump with different velocity and their phase function are \( \varphi_1 = x + q_1 y + \frac{5}{36} q_1^2 t, \varphi_2 = x + q_2 y + \frac{5}{36} q_2^2 t, \varphi_3 = x + q_3 y + \frac{5}{36} q_3^2 t \), respectively. According to expression of phase function, each single lump has no phase shift, in other word, there is no phase shift for these three lumps during collision process.

In Eq (5.1), if taking

\[
q_1 = q_2 = -1 - 2i, q_3 = q_4 = \frac{1}{4} - 3i, q_5 = q_6 = -\frac{2}{3} - \frac{6}{5} i,
\]

we can obtain the elastic interactions among three lump solitons at different time as shown in Figure 9. It can be observed that the three lumps form a triangle structure before the collision. When \( t = 0 \), these three lumps merge into single one. After the collision, the three lumps separate from each other and maintain a triangle structure. The interaction among the lumps is elastic, indicating that these three lumps remain their shapes, amplitudes and velocity both before and after the interactions.

Now, from the Sections 3 to 5, we summarize a few mathematical characters to obtain the interaction among lump soliton(s), and among lump soliton(s) with line soliton(s) or and periodic soliton(s) from five- and six-soliton solutions \( u \) through choosing the appropriate parameters, see Table 1. With the aid of symbolic computation software Maple, the above obtained interaction solutions comprising lump solitons have been verified by substituting them into Eq (1.1).

6. Conclusions

In this paper, we have studied the exact expression of multiple localized wave solutions comprising lump solitons and interaction structures from five-soliton and six-soliton solutions of the CDGKS equation via Hirota bilinear method. Some mathematical features to obtain localized waves and their interactions from the five- and six-soliton solutions were illustrated. By choosing appropriate parameters and using long wave limit method on the five-soliton and six-soliton solutions, some novel results and interaction phenomena have been found including the elastic interactions among one lump and three bell-shaped solitons (see Figure 1), one lump and one periodic breather and one bell-shaped soliton (see Figure 2), one lump and four bell-shaped solitons (see Figure 3), one lump and one periodic breather and two bell-shaped solitons (see Figure 4), one lump and two periodic breathers (see Figure 5), two lumps and one bell-shaped soliton (see Figure 6), two lumps and two bell-shaped solitons (see Figure 7), two lumps and one periodic breather (see Figure 8), and three lumps (see Figure 9). The relevant interaction evolution processes and dynamic characteristics are presented and analyzed. Table 1 shows some mathematical features to obtain localized nonlinear waves and their interactions from the five- and six-soliton solutions of Eq (1.1) about how to choose appropriate parameters. The results presented in this paper might be helpful for understanding some physical phenomena of the propagation of nonlinear localized waves.
